

Complete cycle technology to work with 2D geological models

Data import/export, interpolation, visualisation, analysis, editing; export and printing of graphics; project-based storage of prepared graphical annexes and figures, etc.

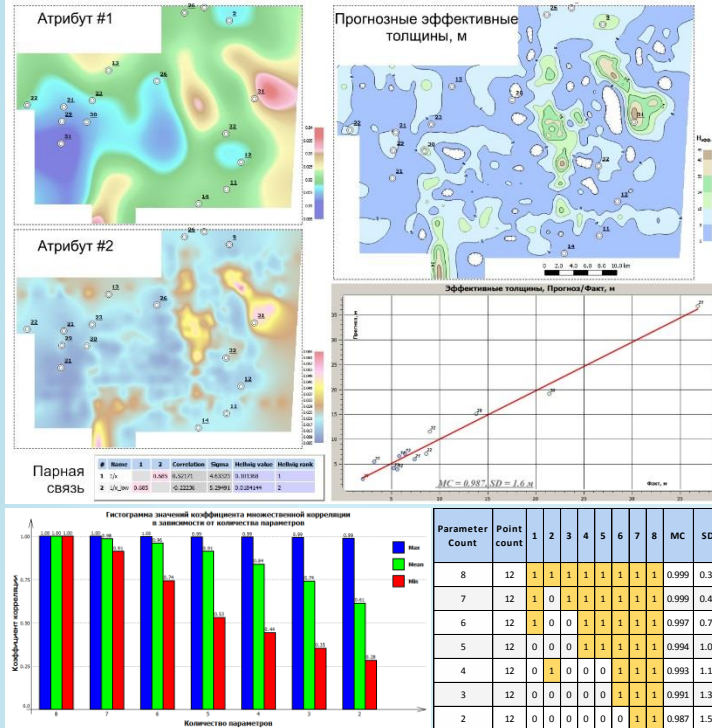

Our software allows to solve a wide range of problems falling within the competence of geologists, geophysical data analysts, geomodellers, and specialists in reserves assessment

Integration of geological and geophysical information

Classification with building a matrix of classes: analysis of geological and geophysical interpretation objects (structural surfaces, thickness maps, petrophysical properties, potential field continuations, etc.), and identification of anomalies of one character against the background of the other

Multiple linear regression with automated validation of references and regressors

Determination of the best combination from any number of regressors and references

Calculation of pair correlation coefficients

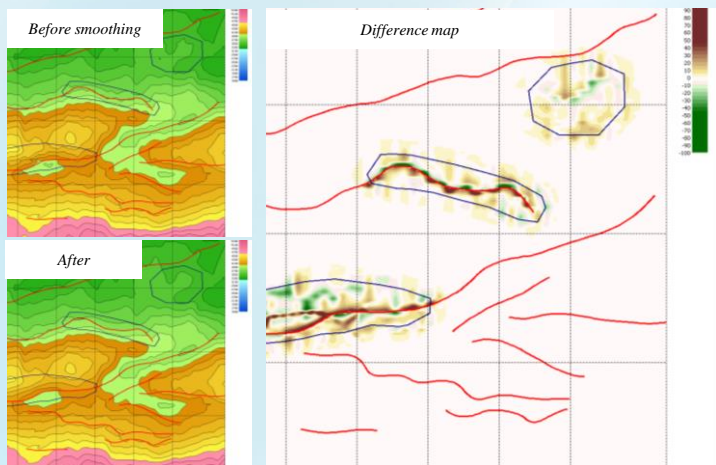

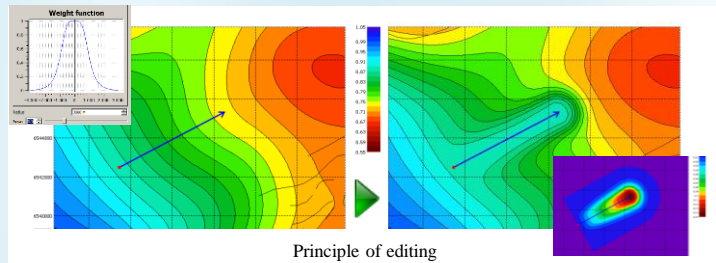

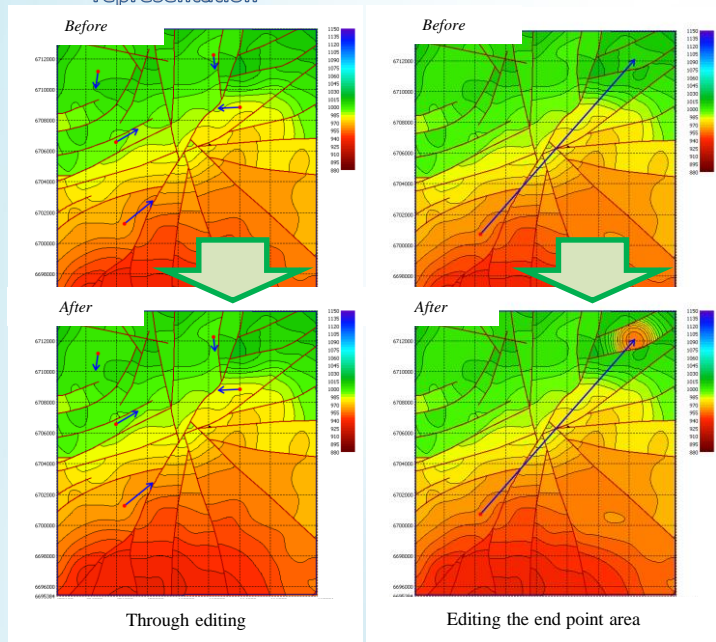

Statistical values output (both graphical and tabular)

Fast, flexible, interactive editing of grid models

Fault tectonics maintenance in the course of calculations with and editing of grids

Processing modes:

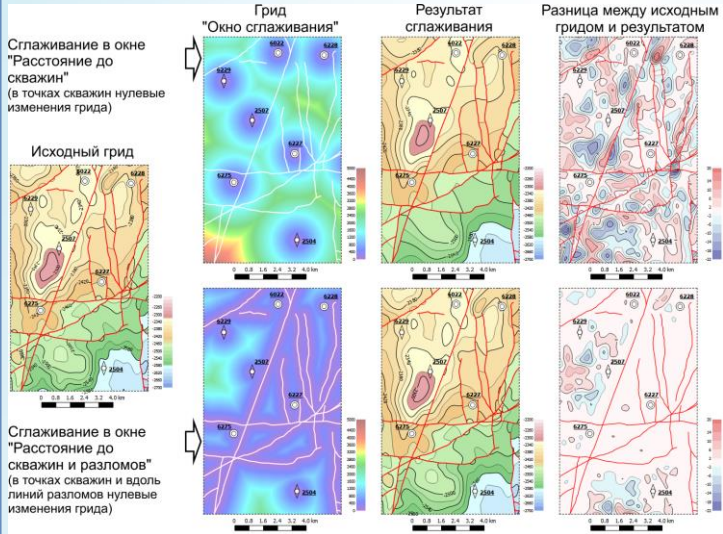

- With temporary polygons: local smoothing, grid blanking taking into account fault lines geometry; copy-paste of grid fragment from one grid to another
- Interactive editing of grid with the use of vectors: changes in grid occur along any number of vector directions

Flexible settings for grid smoothing

Along faults, lines, contours, inside/outside of polygons; with arbitrary window size for each cell (window is grid-dependent), etc.

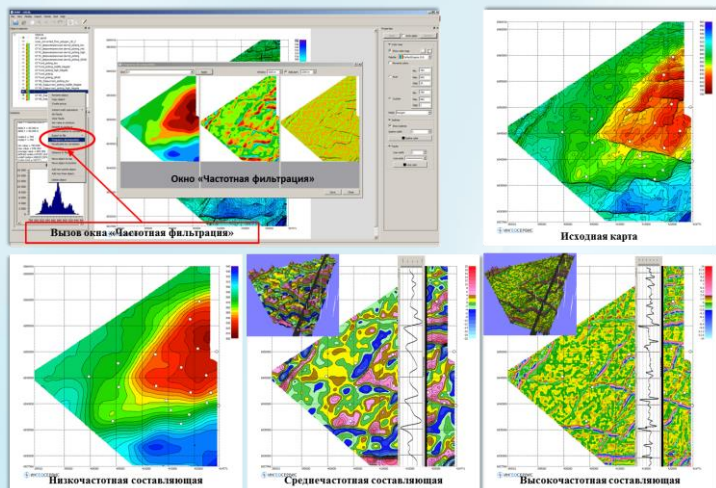

Window-based smoothing taking into account fault line geometry (if any) is used

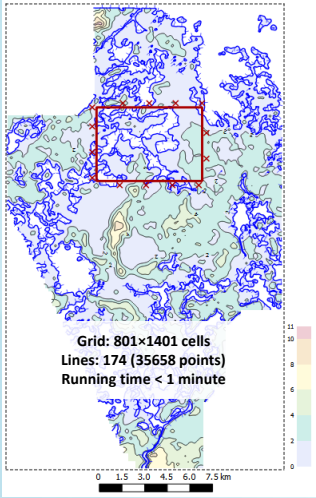

Frequency decomposition

Technology allows solving a wide range of the problems, such as:

Structural and tectonic zoning; delineation and assessment of resources of promising exploration targets; estimation of conditions optimality for oil and gas saturation, and many other

Pinch-out line correction

Structural framework reduction to the defined GWC contour

Automated correction (matching) according to well data and linear objects taking into account faults (GWC, OWC contacts; pinch-outs; contours of amplitude anomalies, etc.)

Implemented algorithms are based on:

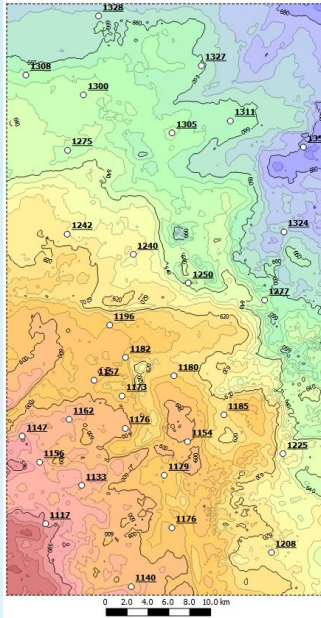

- Interpolation of misfits between grid-based object values and parameter values (point or linear object);
- Well-by-well processing (suitable for wide well spacing, block tectonics)

Method of automated validation

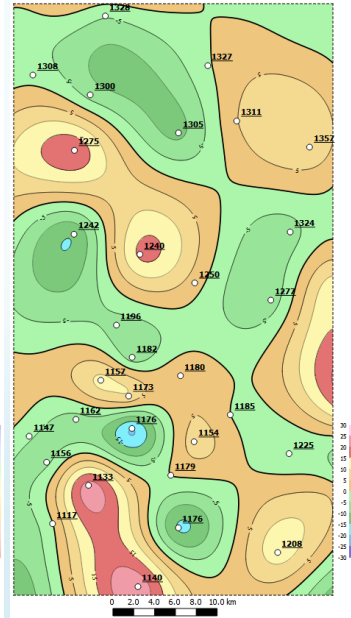

This method is generally used to validate and estimate accuracy of structural imaging, and it can also be applied to estimate accuracy of mapping of any attribute (e.g., thickness, porosity, etc.) carried out with the use of data interpolation techniques

Accuracy of structural map creation is determined by accuracy of average velocity maps based on well data, i.e., by interpolation error that in turn contains errors of time and elevation determination. Method of validation is based on iterative calculation of prediction error where one of the wells is excluded in each run. This method can give a reliable estimate of prediction error when the wells are evenly distributed over the area; modelling tests show that it is efficient when number of wells exceeds 15

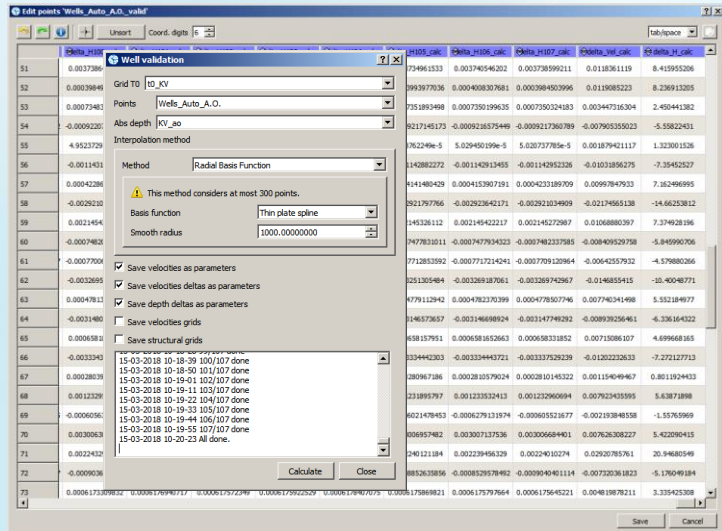

Isochrone map

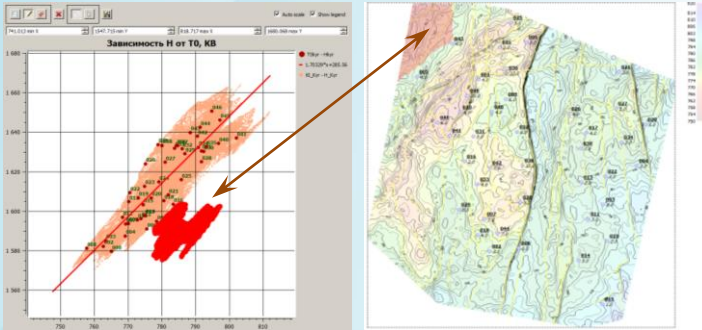

Error map, method of automated validation

Complete control over the calculations; it is possible to save maps and parameters when one of the wells is excluded

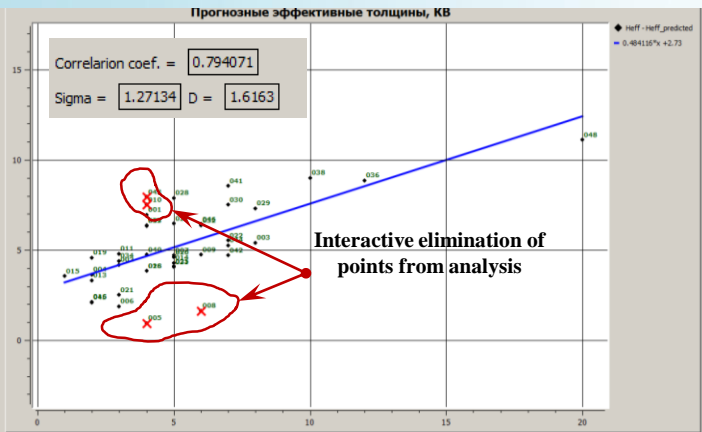

Showing the area of selected points on the map

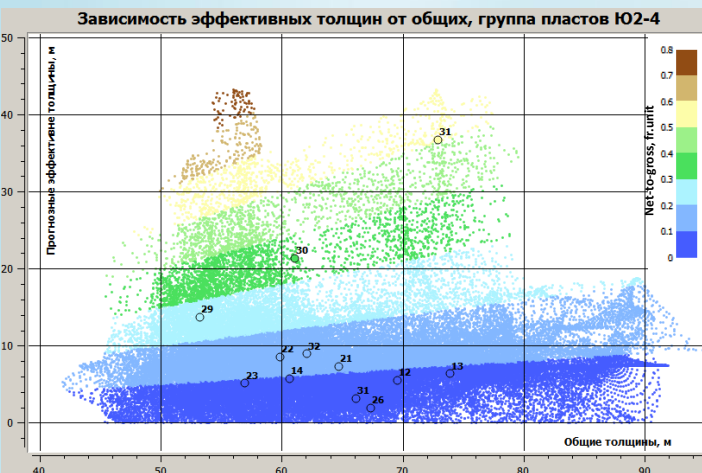

Statistical analysis of links

Building crossplots “grid-grid”, “well-well”, “well-grid”;

Building crossplots with possibility of interactive elimination of points from the analysis

Crossplot is one of the most visual way of representation for both initial data and results. The main purpose of crossplotting is search for and validation of the existing hypotheses and concepts, while visualization, proper substantiation, and interpretation of the patterns obtained is the major task for geologist or geophysicist-analyst.

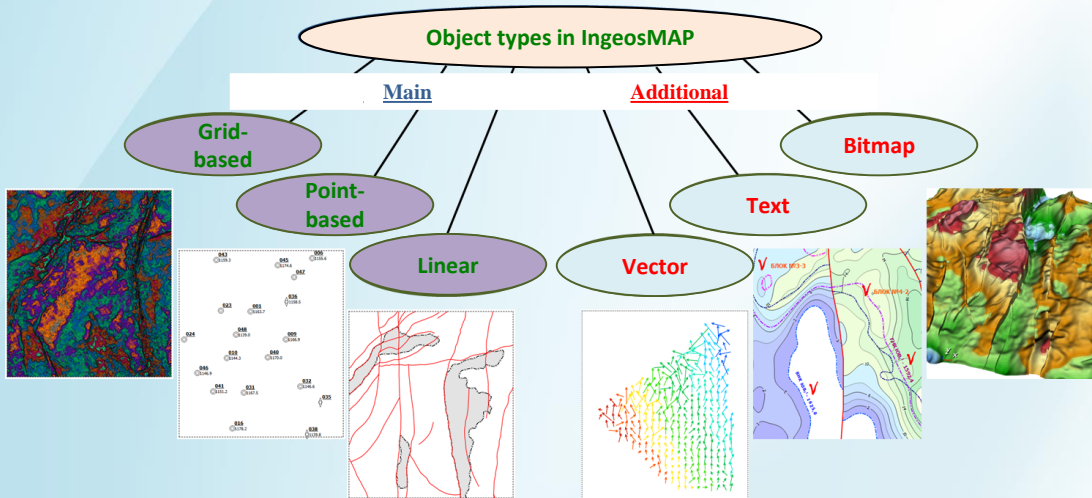

Calculator for coordinates conversion

Possibility to operate with geographical coordinates and normal grids; open library *proj4* is applied; automated conversion of grid-based objects geometry between the projections, taking into account faults (data re-interpolation between grids)

IngeosMAP software technologies

The third-party libraries used: cross-platform; open code and licenses, which allow using them for commercial purposes.

Cross-platform Qt5 (Linux, Windows), LGPL library

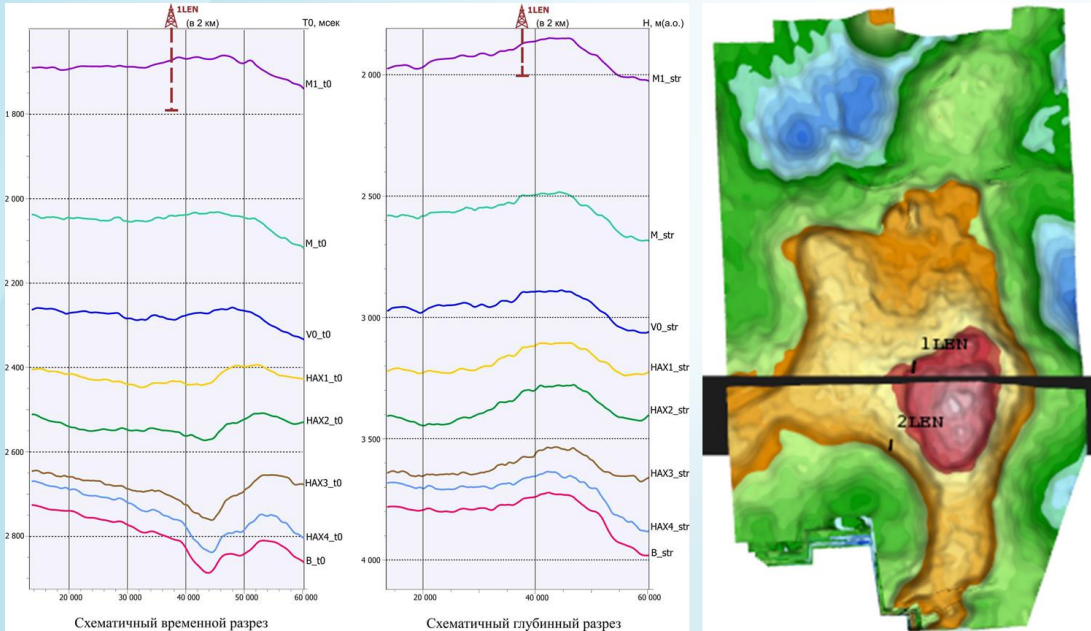

Computer vision library
OpenCV 3.2 image processing and general purpose algorithms, BSD license

Library Qwt 6.1 for graphic presentation of digital data (charts, histograms, diagrams, crossplots), Qwt License compatible with LGPL

Library VTK 7.1 for 3D modelling, images processing and visualization, BSD license

Accounting for velocity anomalies of gas accumulations in structural imaging

Preparation and storing of graphical annexes, preview

The screenshot displays the IMAP software interface with several key components:

- Main Window:** Shows a geological map with various layers and features. The map includes contour lines, structural lines, and different colored zones representing different geological units.
- Object Inspector:** Located on the left, it lists the map's layers, including:
 - new lines object
 - Лицензионный участок
 - 3D-куб
 - wells_KB_porosity_copy
 - wells_KB_porosity
 - 2017-03-15_II(O-2)_skv (C)
 - 2017-03-15_II(O-2)_skv (C)
 - Замещен_О2
 - Выкливание
 - O-1_fault
 - Isolines_from_grid_lr_koll_j
 - Толщины (интерполяция)
 - Кровля пласта
 - Изохроны
 - Прогнозная пористость
 - Прогнозные толщины (ит)
 - Прогнозные толщины (не)
- Printout Setup Dialog:** A central dialog box for configuring the print job.
 - Printout Profile:** Приложение №3, Структурная карта
 - Page Size:** Custom (830,5mm x 986mm)
 - Orientation:** Portrait
 - Print Options:**
 - Map
 - Compass
 - ScaleBar
 - Border
 - Stamp: Структурная карта по кровле пласта ЮВ2
 - Legend: Структурная карта
 - Layout Options:**
 - Sticky zone: 10.0mm
- Properties Panel:** Located on the right, it allows for color and isoline settings.
 - Color map:**
 - Show color map
 - Opacity: 44.0
 - Palette: din4.CLM
 - Reverse colors
 - Auto: (Min: 1130, Max: 1230, Step: 10)
 - Custom: (Min: 1130, Max: 1230, Step: 5)
 - Mode: Ranged
 - Z scale: 84.51971 (Auto scale)
 - Palette mode: White
 - Isolines:**
 - Show isolines
 - Isoline width: 0.6
 - Isoline style: [dropdown]
 - Start level: 1 skip 1
 - Labelled width: 1.3
 - Labelled isoline style: [dropdown]
 - Show isoline labels
- Statistics Panel:** Located at the bottom left, it provides summary data:
 - nodes X = 1599, nodes Y = 1881
 - min value = 1137.93, max value = 1220.49
 - average value = 1174.4
 - defined nodes = 1945/60 (32.3%)
 - Min: 1137.93, Max: 1220.49
 - Count: 100, Cut at the borders
 - Auto from data
 - Coordinates: X=633103 Y=6854615 I=553 J=946 Z=1162.77
- PDF Export Preview:** A window at the bottom showing a preview of the map as a PDF document, including a legend and scale bar.

Andrey N. Zaitsev

Deputy Chief Geologist for Geological Modelling

Arrival of iMAP software product was first of all caused by the lacking of the task-specific software allowing to fully solve a wide range of problems related to G&G data mapping, prediction, and integration. So far, this product is already in use. What is more, the program functionality is not limited to the tasks of building 2D geological models. For instance, multiple linear regression algorithm was used to reconstruct the absent well logs necessary for integrated interpretation. Data operation in normal grids and geographical coordinate systems makes it possible to obtain high-quality results in map-making and design.

Oleg A. Smirnov

Chief Geologist

The time has come to reconsider our views on the current world of modelling technologies, and make it more use-friendly and flexible. Years of experience with trials and errors showed that we have created the complete software product. We would like to present you a world of perfect creativity.

Olga M. Susanina

Lead Specialist in G&G data integration

Convenient, multi-purpose, rapidly advancing tool useful both for conventional tasks and user-specific demands. Allows not only to solve the mapping, modelling and data integration problems, but to analyse the obtained results in the fastest and understandable way at the level of both point and grid-based data.

Nikolay A. Krivousov

INGEOSERVICE-Sk LLC, General Director

iMAP is a really necessary and convenient tool for working in a compressed time frame. Software was developed by experts for specialists. Commercialization of the project and reduction of geologic hazards of drilling wells while building the correct geological model - that's what the user of this excellent software gets.

Anastasia V. Poluyakhtova

Lead Geophysicist

We dreamed of analysts' wishes to be fulfilled. And our dreams came true! High mobility, striking efficiency, multifunctionality, clear and sensible user interface are the most attractive features of iMAP. I really like to use "one button" to start massive statistical calculations.
